

GB CLP hazard symbols

Acute toxicity

Short-term exposure, such as inhalation or contact with skin, may be toxic or fatal.

Health hazard or hazardous to the ozone layer

Exposure can result in irritation, drowsiness or dizziness, or cause less serious toxicity.

Serious health hazard

Long-term exposure may cause serious and prolonged health effects.

Oxidising

The substance may cause or intensify a fire by increasing the concentration of oxygen in the air.

Flammable

The substance is flammable if exposed to an ignition source, spark, or heat.

Explosive

The substance may explode or mass explode if exposed to an ignition source.

Corrosive

Exposure can cause severe skin burns and eye damage. The substance may also be corrosive to metals.

Gas under pressure

The substance contains compressed, liquefied or dissolved gas. It may explode if heated.

Hazardous to the environment

The substance can have acute or long-term impacts on aquatic life.
